

One destination $i = 2$, three contributing slope stages j

Every shaded integral runs from 0 to $\tau_2 = \frac{1}{2}$.

$j = 1 : \ell_1(\tau)$

$$A_{21} = \int_0^{1/2} \ell_1(\tau) d\tau = \frac{5}{24}$$

$j = 2 : \ell_2(\tau)$

$$A_{22} = \int_0^{1/2} \ell_2(\tau) d\tau = \frac{1}{3}$$

$j = 3 : \ell_3(\tau)$

$$A_{23} = \int_0^{1/2} \ell_3(\tau) d\tau = -\frac{1}{24}$$

$$x_{k,2} = x_k + h_k \underbrace{\left(\frac{5}{24} f_{k,1} + \frac{1}{3} f_{k,2} - \frac{1}{24} f_{k,3} \right)}_{\sum_{j=1}^3 A_{2j} f_{k,j}}$$

Even the slope at $\tau_3 = 1$ contributes to the state at $\tau_2 = \frac{1}{2}$.
